

TI22 denominates the element titanium in the periodic table. For this reason our genuine acetate spectacles with specially engineered solid titanium comb hinges carry this name. The hinge comes in various types and styles. Something they have all in common is a rugged structure encased in wonderfully sculpted curvatures.

Like in the good old days when things used to feel better, we go for a simple and steady construct, however, our nuts and bolts are screws. Front piece and hinge are connected with a screw, since we use no glue and our metal parts are not fused to the acetate, all components can be disassembled and replaced.

Cellulose acetate is basically a natural material, although somewhat synthesized. Our shapes are carefully handcrafted and hand-polished. The 8 mm thick acetate material we solely use for our styles is exclusively made for our TI22's, which enables us to cut sophisticated and detailed shapes with elaborate recesses and sculpted profiles.
